Automating Employee Data

PROBLEM STATEMENT:

In many organizations, **employee data** is managed manually or across **multiple systems**, leading to **inefficiencies and inconsistencies**. Tasks such as updating employee details, managing role changes, and tracking employee status require **repetitive effort** and are prone to **human errors**.

This results in **inaccurate or outdated information**, affecting **decision-making** and productivity. Therefore, there is a need for an **automated solution** to streamline employee data management, improve accuracy, and maintain consistency using a **centralized platform like ServiceNow**.

OBJECTIVES:

- To **automate the management of employee data** by reducing manual data entry and administrative effort.
- To **import and integrate external employee data** into ServiceNow using Import Sets and Transform Maps.
- To **ensure accurate and consistent data mapping** into the User (sys_user) table, including proper handling of reference fields such as Manager.
- To **enhance form usability** by displaying related user information (Department, Email, Manager) using dot walking.
- To **customize system behavior** using Dictionary Override without affecting other dependent tables.
- To **improve operational efficiency and data accuracy** by minimizing human errors in employee data handling.

- To **validate system functionality** through testing and ensure seamless integration of employee data with incident management.

SKILLS USED:

- ServiceNow
- Import Sets
- Transform Maps
- Update Sets
- Table Configuration
- Form Configuration
- Dot Walking

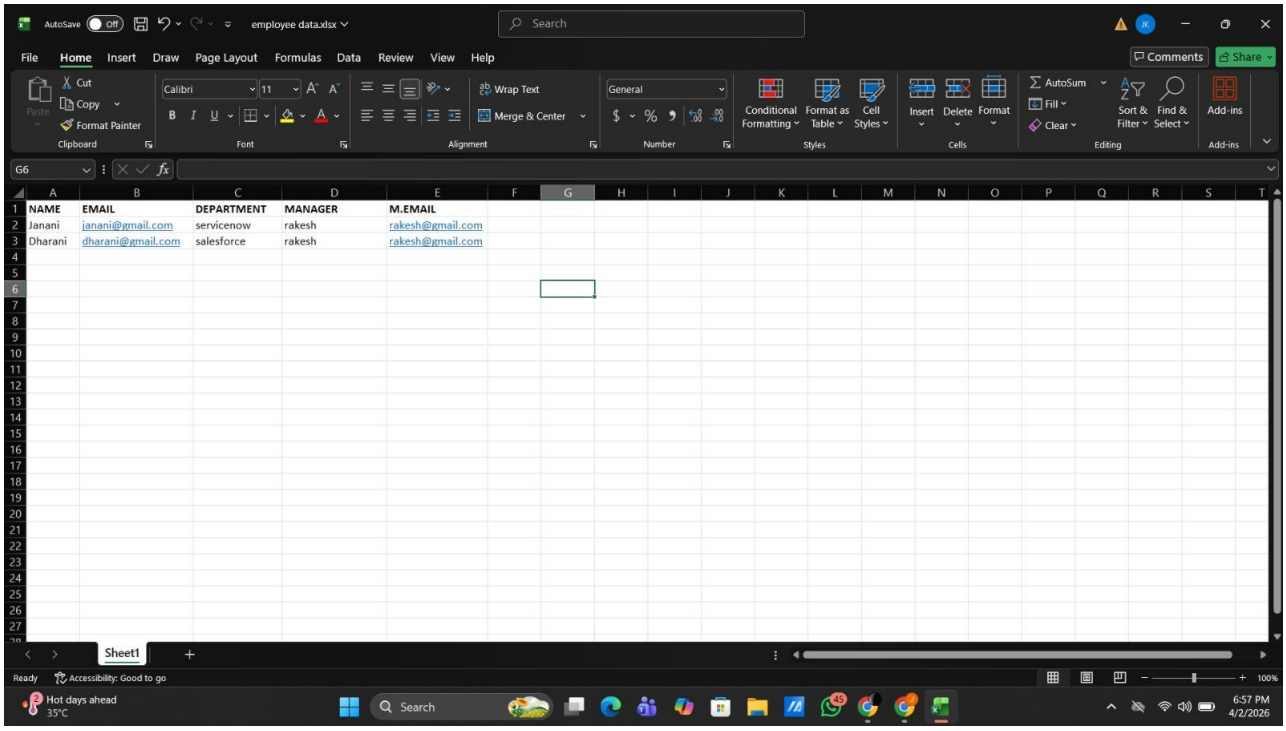
TASK INITIATION

MILESTONE 1: Import data from data source

ACTIVITY 1: Create records in the Sheet

Steps:

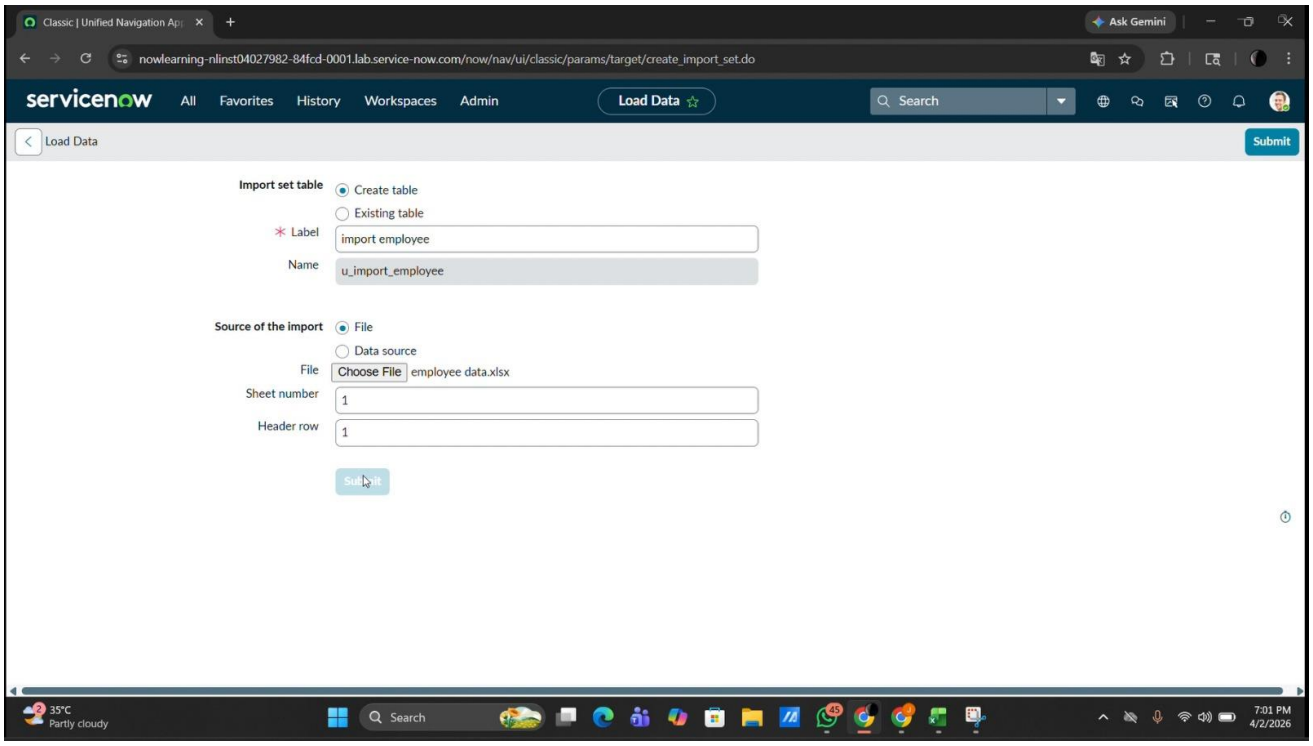
1. Open google sheet.
2. Name the fields as name, email, department manager and manager's email
3. Enter some records
4. Save the sheet as: employee data
5. Download the file as .xlsx, .csv (or) .xml file.



ACTIVITY 2: Import data

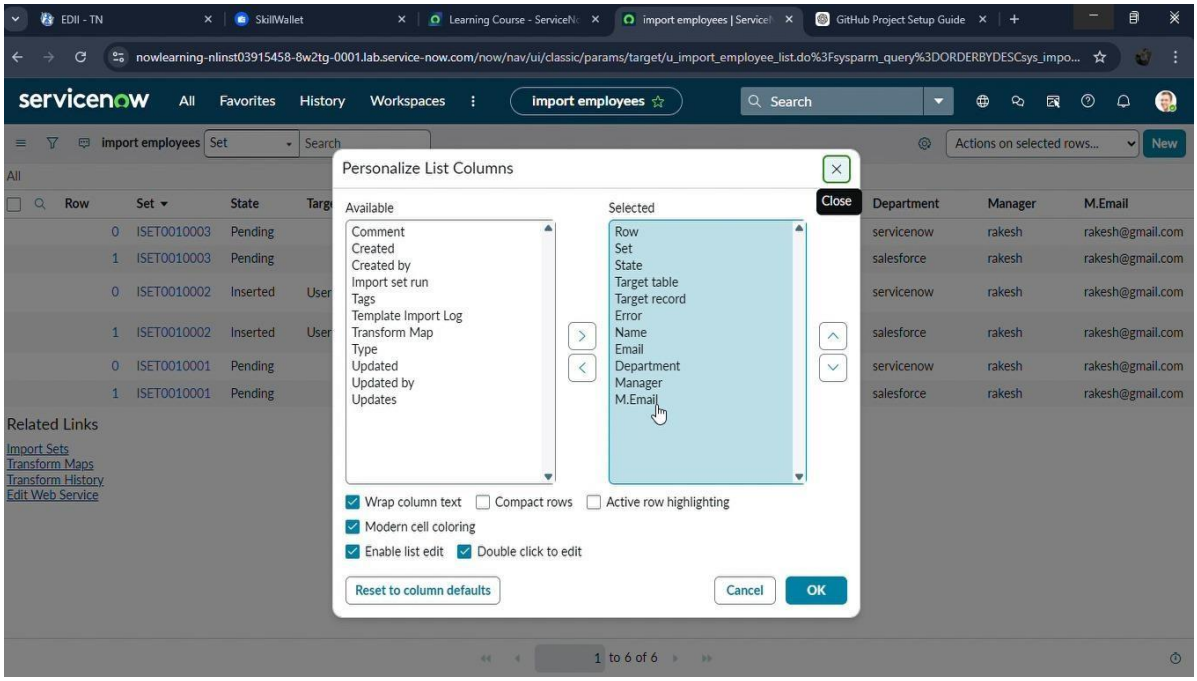
Steps:

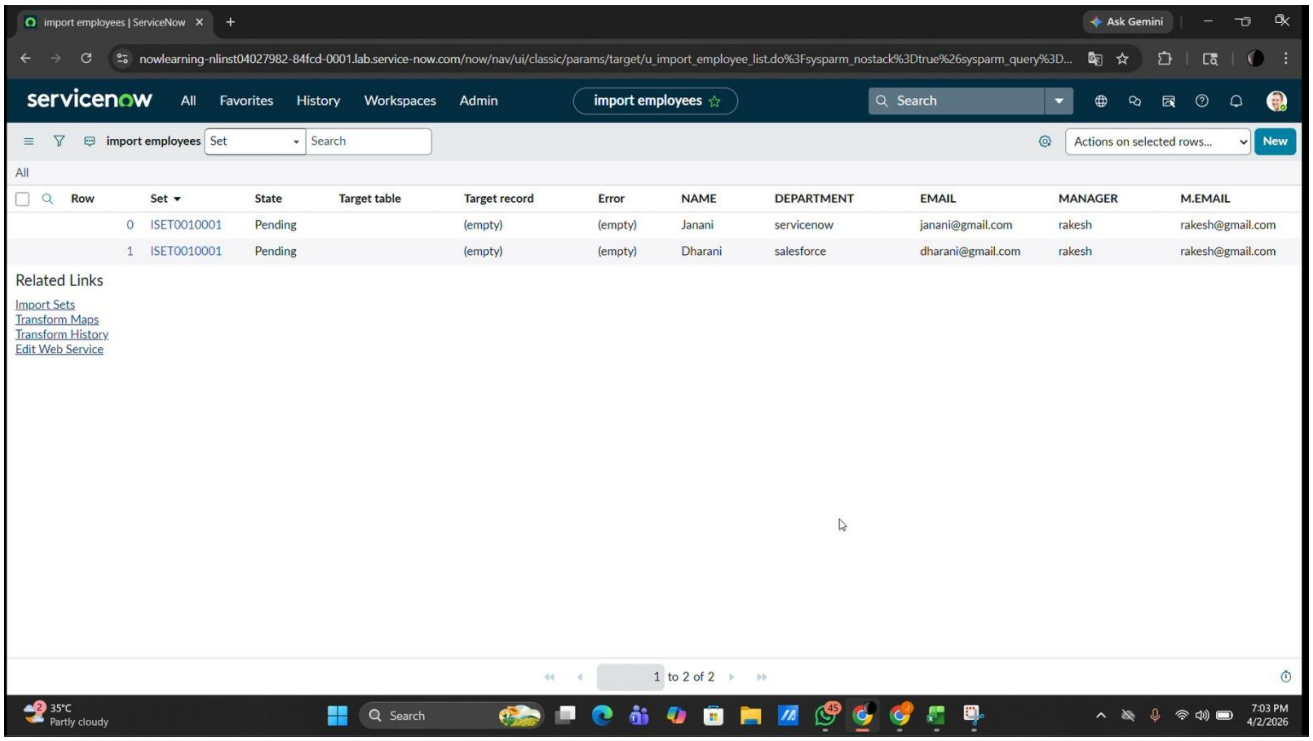
1. Open service now.
2. Click on All >> search for import sets
3. Select load data under system import sets
4. select create table
5. Give the import set table name as: import employee
6. Choose the file which we created in the XL sheet.



7. The data is imported, click on personalized list

8. Add fields to the form.

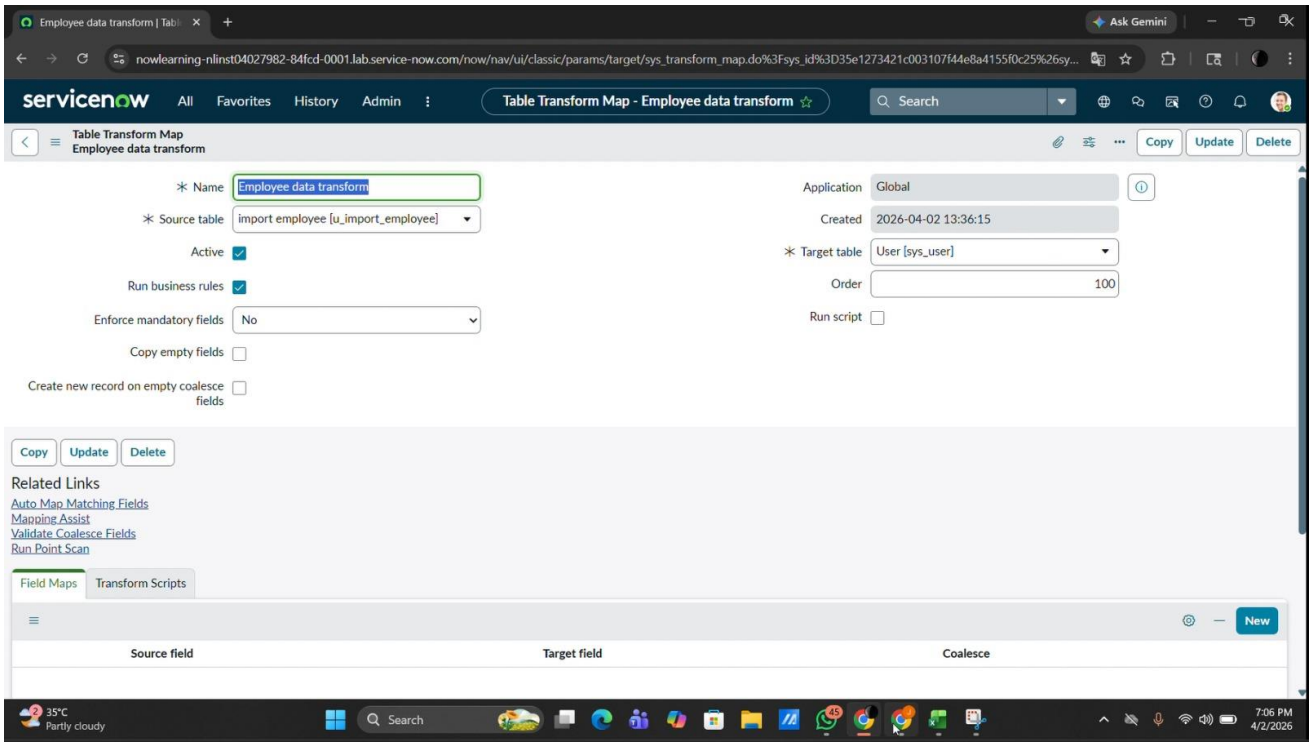




ACTIVITY 3: Create transform map

Steps:

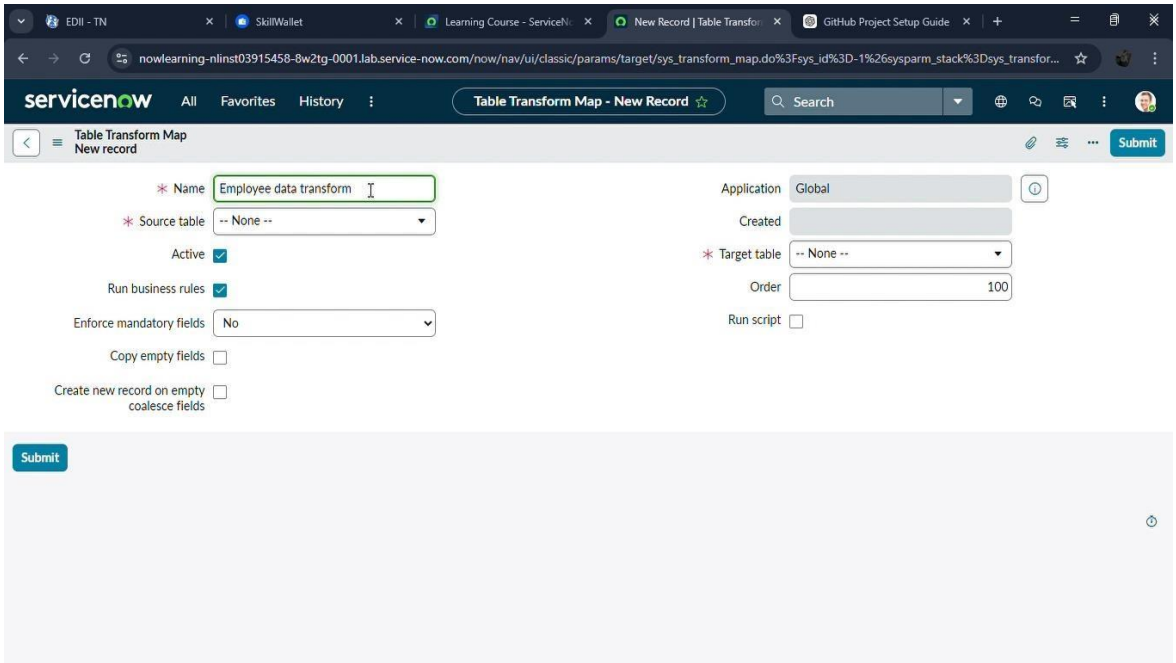
1. Open service now.
2. Click on All >> search for import set
3. Select create transform map under import sets
4. Click on new
5. Fill the following details to create a new transform map
6. Give name as: Employee data transform
7. Select source table: import employee data
8. Select target table: user[sys_user]
9. Save the form.



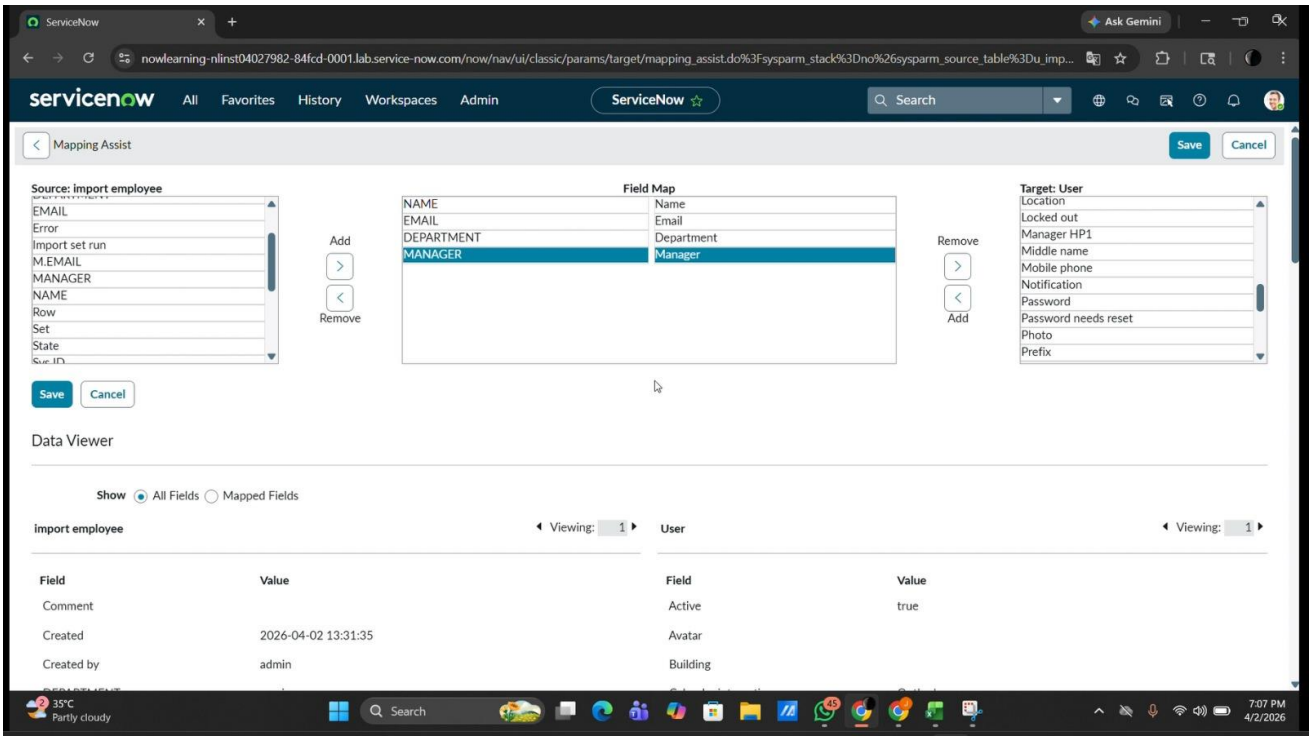
ACTIVITY 4: Match the fields using mapping assist

Steps:

1. Scrolled down the created transform map form
2. Click on auto matching fields
3. Then in the mapping fields some fields are matched



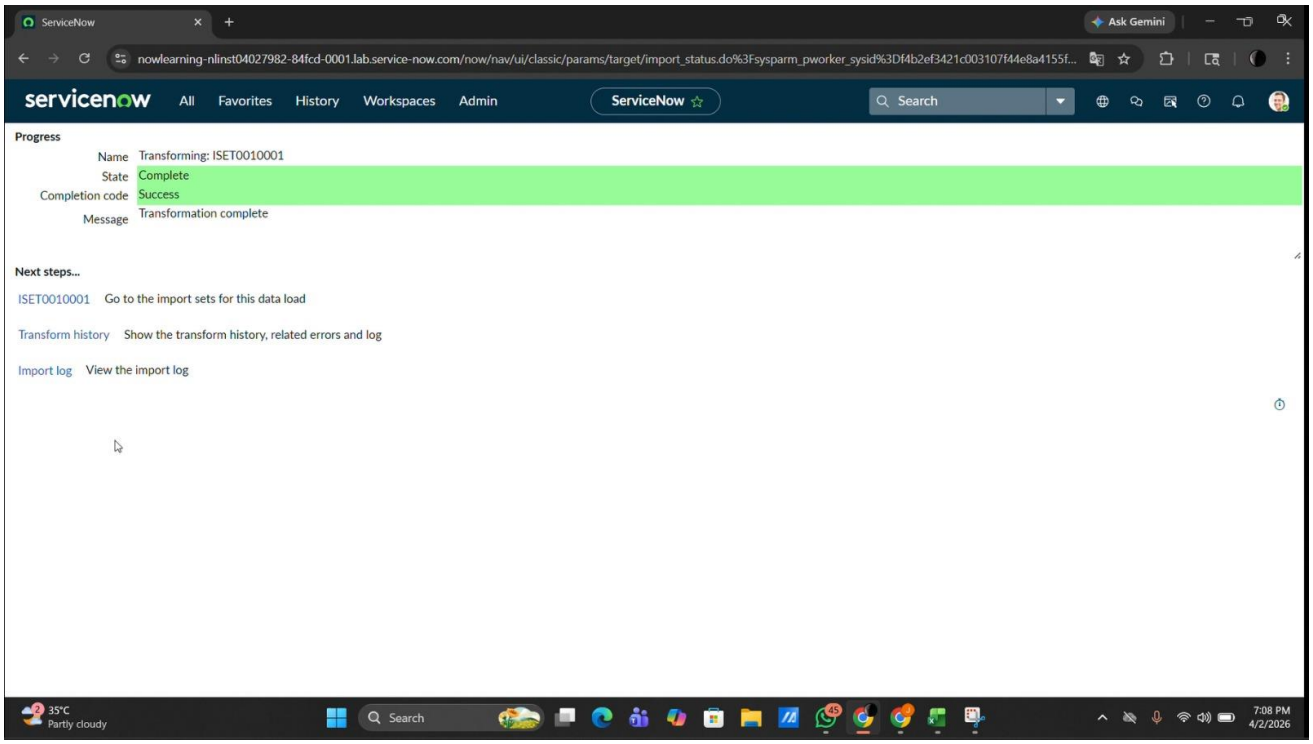
4. Using mapping assist map the manager field.
5. Select the fields which you are mapping in the staging table and target table
6. Select manager in source table and add
7. Select manager field in target table
8. Click on the save button.



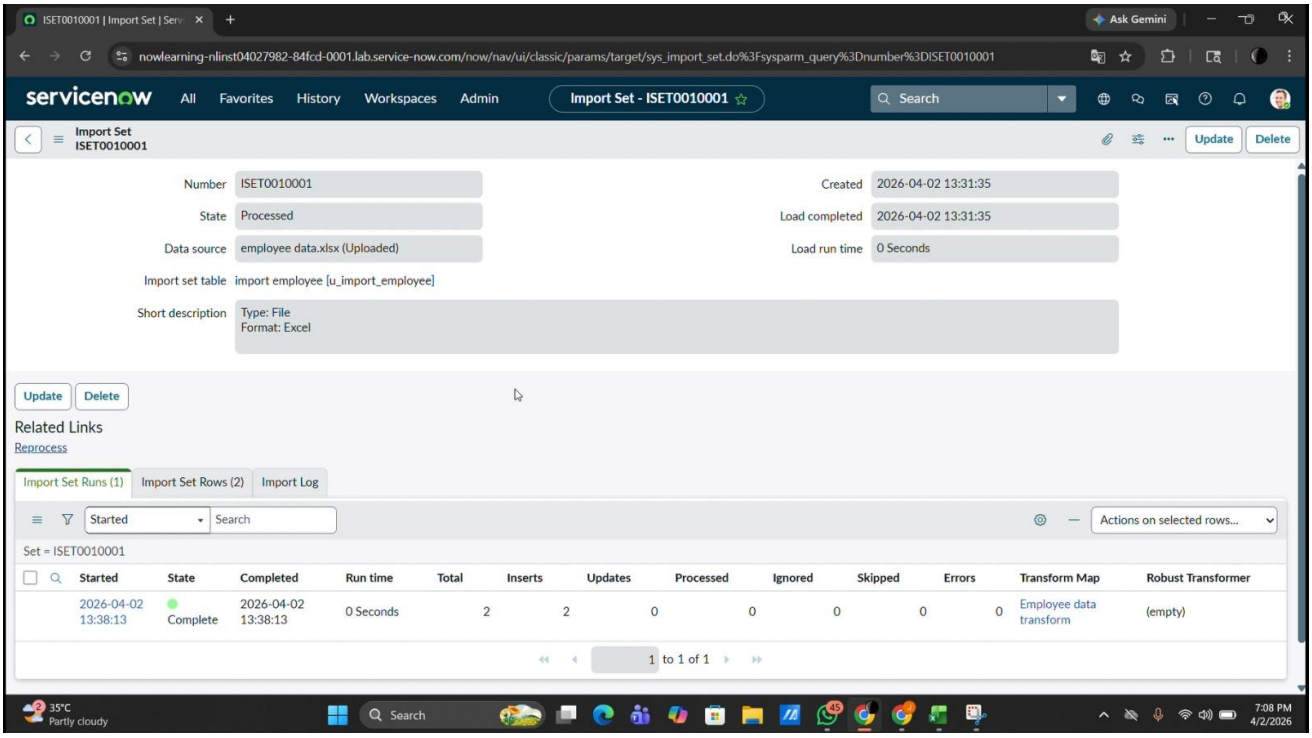
ACTIVITY 5: Transform the Data

Steps:

1. Click on transform in the related links.
2. Click on transform.
3. Data's transform state is completed.



4. Click on ISET0010003 under next steps
5. Two rows are inserted.

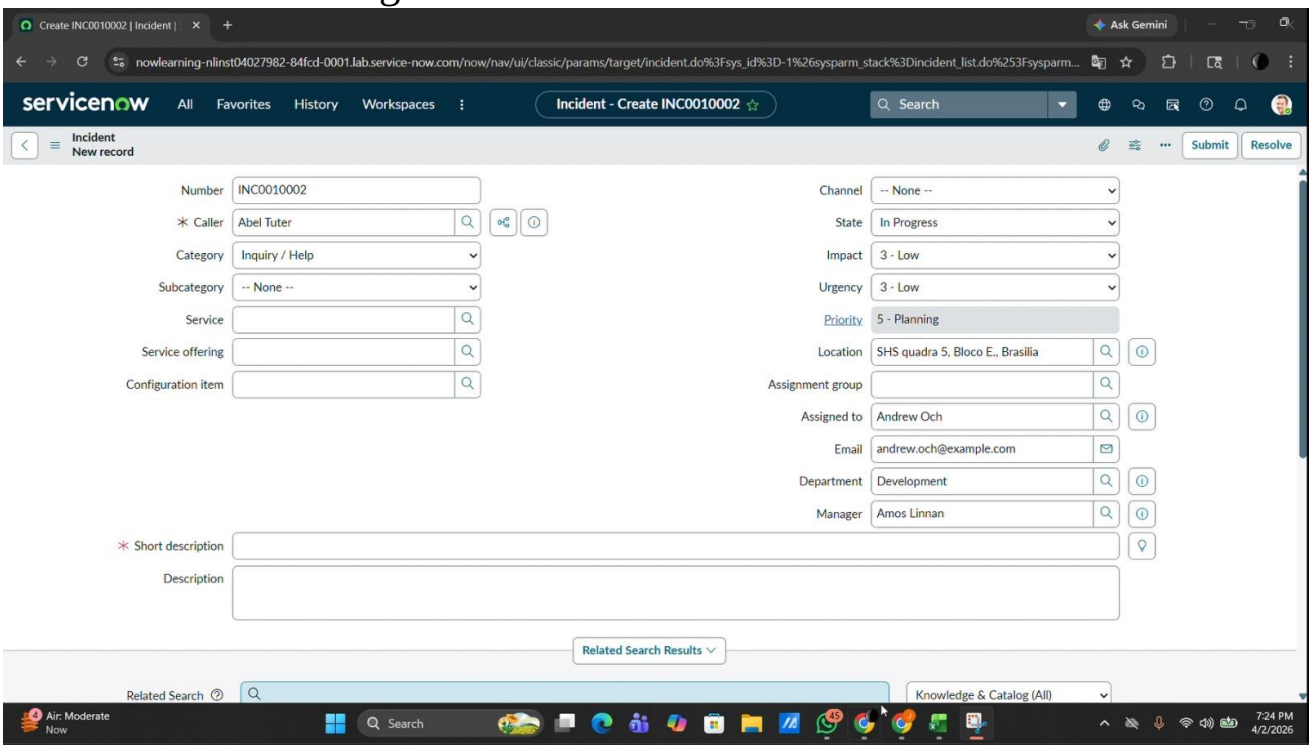


MILESTONE 2: Dot walking

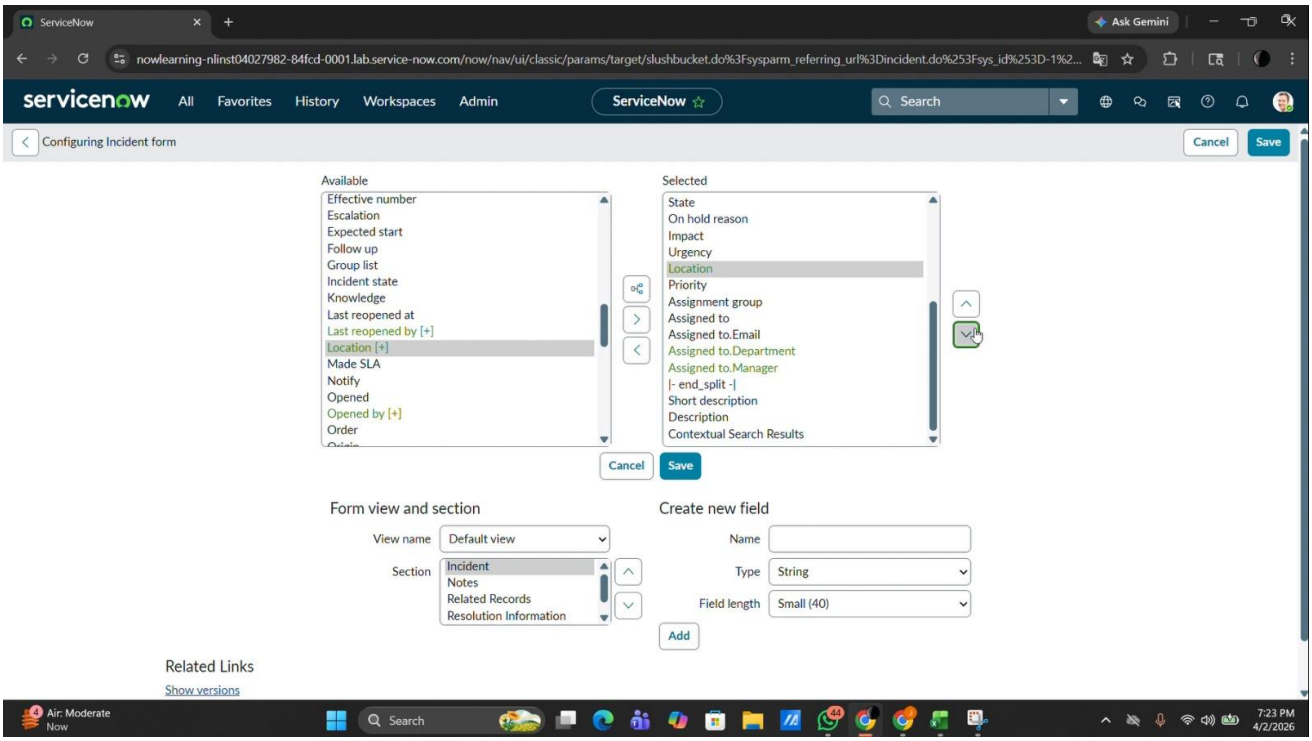
ACTIVITY 1: Display department to the assigned to user

Steps:

1. Open service now.
2. Click on All >> incident
3. Select create new under incidents
4. There is no field like department in the form
5. Email and manager fields are not visible



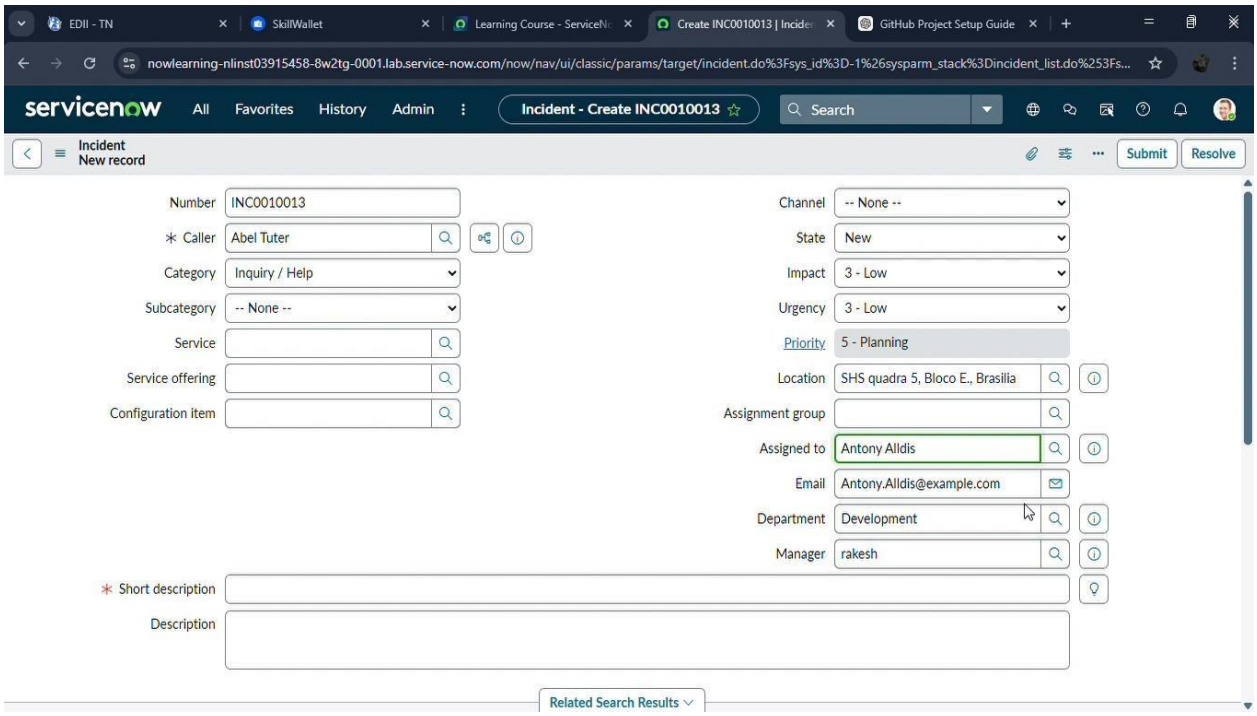
6. By using dot walking retrieve the data without opening the record
7. Click on context menu go to configure and select form layout
8. Select assigned to.department as mentioned below
9. Add another field assignment.email and assignment.manager field.
10. Click on save.



11. Open an incident form

12. Fill the mandatory fields and assigned to just imported user

13. Then department and email field is automatically filled

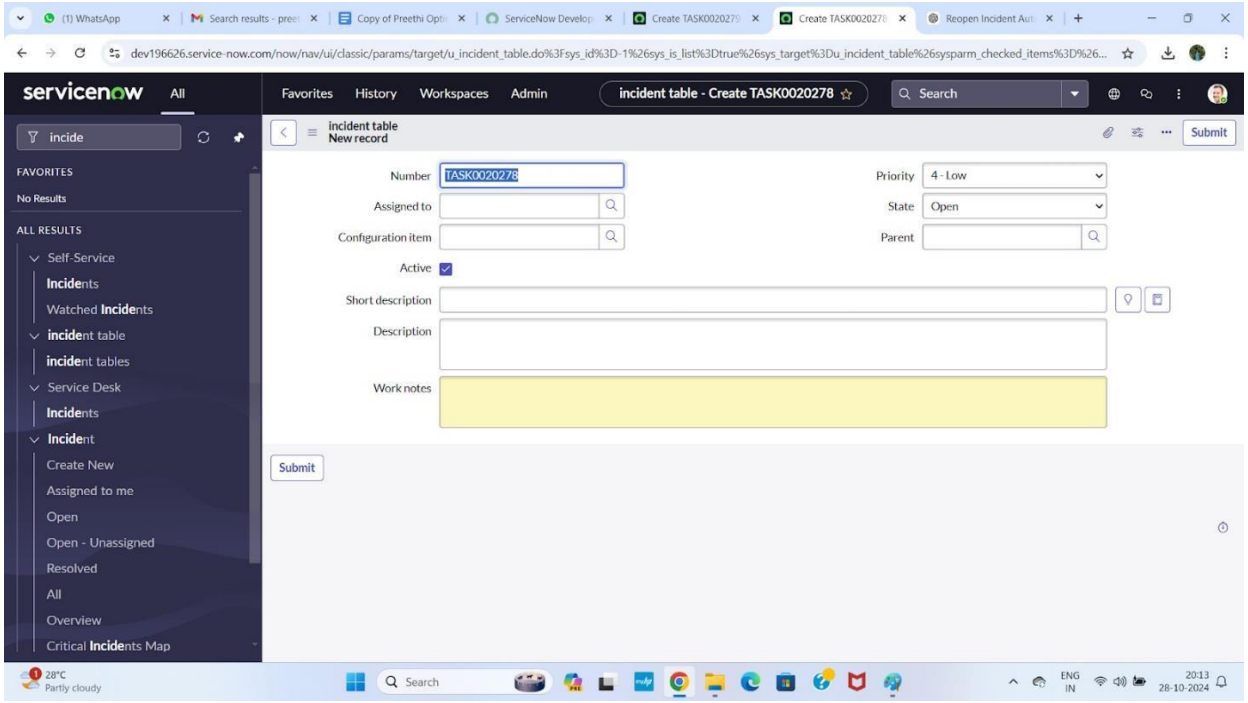


MILESTONE 3: Dictionary override

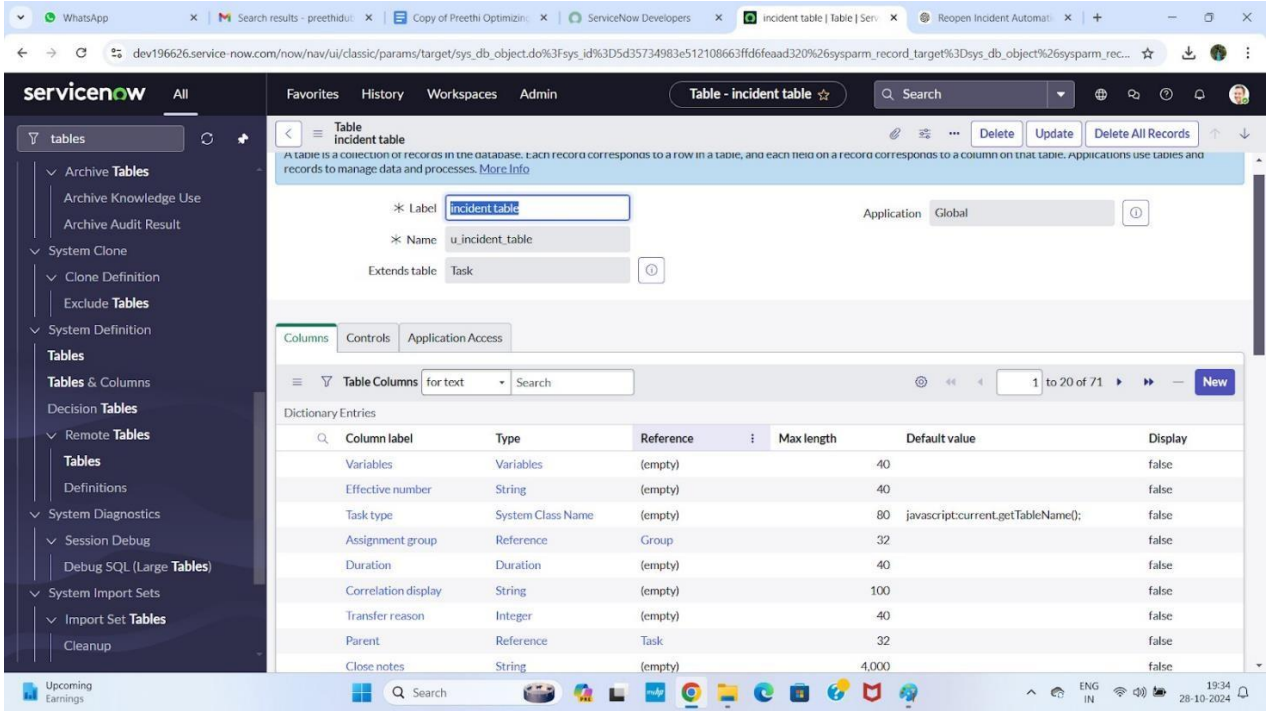
ACTIVITY 1: Make the state to 3-moderate in incident

Steps:

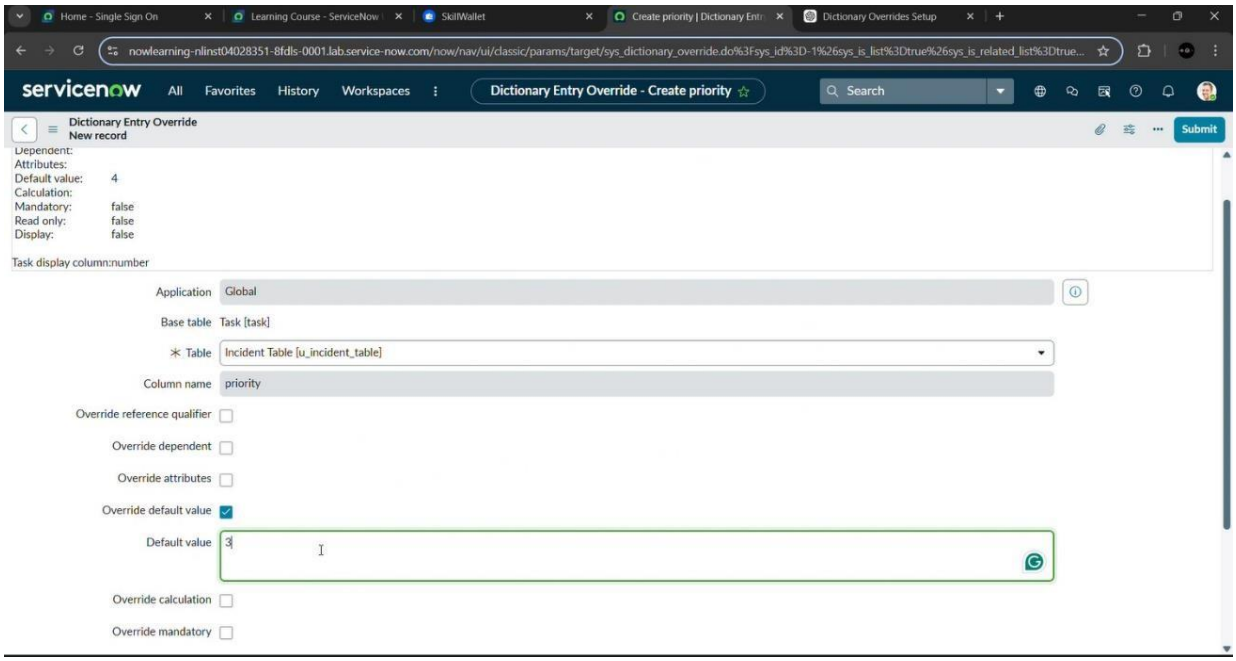
1. Navigate to All → System Definition → Tables.
2. Either:
3. Use the existing Incident table (which extends Task), OR
4. Create a new table (e.g., u_incident_table) and set Extends Table = Task.
5. Open the Incident (or extended) table record.
6. Go to the Columns related list and open the Priority field. Notice the default value is inherited from the Task table (e.g., 4 – Low).



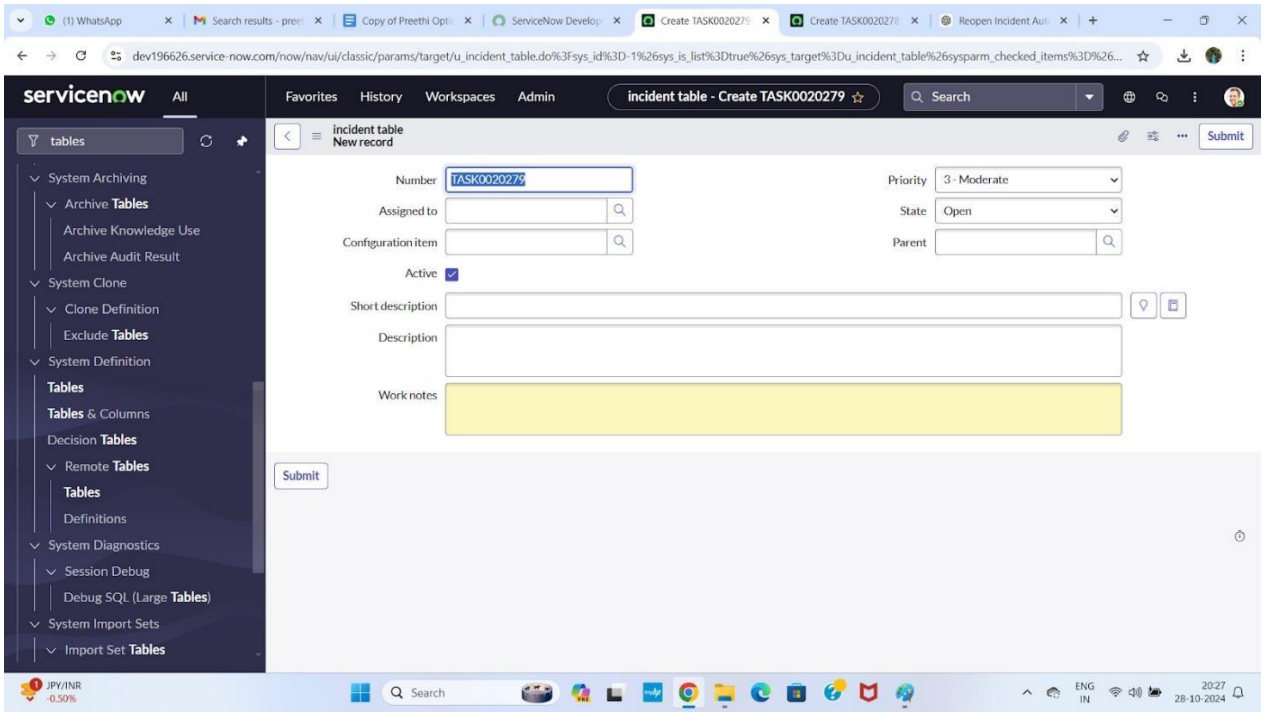
7. Scroll down and locate the Dictionary Overrides related list.



8. Click New under Dictionary Overrides.
9. Fill the following details:
10. Table: Incident (or your extended table)
11. Column name: Priority
12. Check Override default value
13. Set Default value = 3
14. Click Submit.



15. Open a new Incident record and verify that the Priority now defaults to 3 – Moderate, while the Task table still retains its original default value.



Conclusion:

This project successfully enhanced incident management by integrating external employee data into ServiceNow using Import Sets and Transform Maps, eliminating manual data entry and ensuring accurate user records. The implementation of dot walking enabled real-time access to related information such as department and manager details directly within the Incident form.

Furthermore, the use of Dictionary Override allowed customization of the default Priority value specifically for the Incident table without affecting other Task-related tables.

Overall, the system improves data accuracy, reduces administrative effort, and provides better visibility of critical information, resulting in a more efficient and structured incident management process.
